A three-phase inverter distinguishes itself by transforming DC power into three separate AC waveforms. This configuration is tailored to three-phase electrical systems. These systems are renowned for their enhanced efficiency, reliability, and capacity to handle larger loads compared to single-phase counterparts.

Our 3 phase hybrid inverter seamlessly connects your solar PV, storage battery, and home. With a range of capacities on offer, you can choose the inverter best-suited to your power needs.

Let's say you have a 150sqm of rooftop fully covered by PV. You probably get a max of 30kW solar input. If you are using an inverter with up to 10kW AC output. If the solar panels work at full capacity on a sunny day, up to 20kW of solar energy will be wasted. If you are using 15kW of electricity in your home, you will be buying the additional 5kW of AC input from the grid.

You don't typically need to switch to three-phase electricity when you get solar panels. Most residential solar panel systems come with a single-phase solar inverter that works seamlessly with your existing electricity supply.

A three-phase supply provides higher efficiency and power capacity. In turn, then, it allows homes to scale up their solar PV and battery storage, plus enjoy faster home EV charging. And from a grid perspective, three-phase offers all-new fluidity.

Typically, a three-phase system has three 100 amp fuses. Another way to check is by looking at the wires coming out of the metre. If there are three or four wires, you have a three-phase electricity supply. If there are only two, it's a single-phase system. Is three-phase electricity more expensive than single-phase electricity?

3 phase solar inverters are reliable, efficient, and affordable. Like any inverter, they convert DC power generated by solar panels into AC electricity just like any inverter. However, a three phase solar inverter does something extra, which is, it splits the AC into 3 chunks for a three phase supply.
