I would always choose the higher voltage panel (all other things being equal). I am running 250w panels (30.3v / 8.37a) in series sets of three to bump the voltage up to ~92-100vdc and then combining three sets (parallel) into a combiner box. Ultimately you just need to make more voltage than 14.4v, so either style panel

When we connect N-number of solar cells in series then we get two terminals and the voltage across these two terminals is the sum of the voltages of the cells connected in series. For example, if the of a single cell is 0.3 V and 10 such cells are connected in series than the total voltage across the string will be $0.3 \text{ V} \times 10 = 3 \text{ Volts}$.
