How does a solar cell work?

Each solar cell is made of multiple layers. The top semiconductor is a negative layer, which means the material contains extra electrons. The sun's energy "shakes" these electrons loose, and these electrons become naturally attracted to the bottom semiconductor layer, which is positively charged.

How does solar energy affect a cell?

The sun's energy "shakes" these electrons loose, and these electrons become naturally attracted to the bottom semiconductor layer, which is positively charged. The design of the cell forces electrons to move in a specific direction, creating an electrical current.
