What is a dc microgrid?

The DC microgrid supplies large parts of the building infrastructure, from office workstations and lighting to laboratories and charging stations for electric vehicles. Power is fed from PV strings with different orientations (south and east/west) on the roof, and a maximum combined power of 43 kW.

What is a hybrid DC/AC microgrid?

The best qualities of DC and AC microgrids are combined in a hybrid DC/AC microgrid. To increase overall efficiency, this type of topology connects DC and AC loads to separate but complementary DC and AC grids. Another benefit is that electric vehicle charging stations can be hardwired into the DC bus.

Thus, this article documents developments in the planning, operation, and control of DC microgrids covered in research in the past 15 years. DC microgrid planning, operation, and control challenges and opportunities are discussed.

Does a DC microgrid save energy in a building?

Although an efficiency savings of 10-18% for a DC lighting and building microgrid is significant, it saves energy by aligning the DC microgrid voltage with the voltage(s) accepted by other building loads. Lighting is not the only possible DC load.

Still, more work remains to promote DC microgrids from the demand side. Lack of native DC devices: One of the barriers to DC microgrid adoption is the comparative lack of DC-ready products. Manufacturers are reluctant to make DC products unless there's a market, but the market can't develop without products to support it.

Microgrids (MGs) are driving us toward more resilient power grids. They can operate independently from the upstream power grids and provide a reliable source of power to their customers. Conventionally, ac MGs have been deployed to increase the reliability and resilience of power grids or provide power to remote areas where connection to an electric ...

On the other hand, DC-MGs could offer various merits compared to AC-MGs: more efficient supply of DC loads, loss reduction via decreasing the multiple converters used for DC loads, facilitate various DC-DERs integration such as fuel cells (FC) and photovoltaic systems (PV) to the common node with simplified interfaces, and decreasing the need for ...
