What is a connect Saint Helena microgrid?

The agreement with Connect Saint Helena Ltd includes a microgrid for the South Atlantic island that combines a 568 kWp/500 kW solar farm; a three-turbine, 2.7 MW wind farm; and a 3.2 MWh/3.5 MW battery.

Why do we need a microgrid?

Additionally, microgrids provide an essential backup power source in case of outages or natural disasters and enable greater control over local energy production. A microgrid can disconnect from the central grid and operate independently.

How will a microgrid help the South Atlantic island?

The microgrid will help the South Atlantic island's aim of investing in renewables, reducing diesel dependence and increasing fuel security and price stabilization. The project will accelerate the climate change goals of the British overseas territory.

How to design a microgrid?

A microgrid conceptual design should be created, including preliminary sizing and citing of distributed energy resources, preliminary electrical one-lines, and control system architecture, including desired modes of operation and switching sequences.

What should be included in a microgrid configuration?

The microgrid configuration should be identified, including point (s) of interconnection with the utility grid and existing and future distributed energy resources (DERs) such as solar, wind, combined heat and power (CHP), fuel cells, and energy storage.

How long should a microgrid system last?

Different scenarios should be considered regarding short- and long-term microgrid system configurations, including critical load uptime and black-start/extended outage capabilities ranging from one hour to one week.
