In a shift from the traditional electric power paradigm, utilities and utility customers are installing distributed generation (DG) facilities that employ small-scale technologies to produce electricity closer to the end use of power. Grid parity occurs when an alternative energy source can generate electricity at a levelized cost that is less than or equal to the end consumer's retail price. Reaching grid parity is considered to be the point at which an energy source becomes a contender for widespread development without subsidies or government support. Since the 2010s, grid parity for solar and wind has become ...

Since distributed solar is "behind" the meter, customers do not pay the utility for the solar power generated. The cost of owning DER varies from state to state and among utility companies. One way the electric bill is determined is through net metering, where utilities calculate the total power generated by the customer's solar system and subtract it from the total power the customer ...

This makes net metering especially attractive to owners of intermittent power generation systems--such as solar panels or wind turbines--that rely on the right weather conditions. ... Energy costs are volatile--subject to ...

For example, a 2011 report by the Virginia State Corporation Commission examined the potential costs of increasing net-metered distributed solar power to 1 % of each utility's peak load, crediting solar with only the avoided cost that utilities would otherwise have to pay to generate and transmit that electricity, plus a small amount of avoided generation ...

They can quickly modulate power load, shift daily energy consumption to match solar generation, and reduce peak demand in an emergency without any noticeable disruption to consumers. Smart heat pump water heaters are less responsive, but can help manage daily energy demand and produce 2.5 to 3 times more energy than they consume.

I. Distributed Generation, Net Metering, and Feed-in Tariffs What Is Distributed Generation? Distributed Generation refers to power produced at the point of consumption. DG resources, or distributed energy resources (DER), are small-scale energy resources that typically range in size from 3 kilowatts (kW) to 10 megawatts (MW) or larger.
