Solar energy comes from the limitless power source that is the sun. It is a clean, inexpensive, renewable resource that can be harnessed virtually everywhere. Any point where sunlight hits the Earth"s surface has the potential to generate solar power. Unlike fossil fuels, solar power is renewable. Solar power is renewable by nature.

Despite the many benefits of CSP, it does have its downsides. For one, it"s largely dependent on location. Similar to solar PV and wind power, CSP plants require a large area of land to operate, which makes it uneconomical in populated areas. Concentrated solar power uses a lot of water to drive steam turbines and to cool thermochemical reactors.

The most important issues pertaining to solar power plants using CSP technology are 13: High efficiency is obtainable since the thermodynamic cycles are fed by high-temperature input. ... CSP systems are not appropriate for small-scale power generation since they require high capital cost.

A solar module comprises six components, but arguably the most important one is the photovoltaic cell, which generates electricity. The conversion of sunlight, made up of particles called photons, into electrical energy by a solar cell is called the "photovoltaic effect"; - hence why we refer to solar cells as "photovoltaic";, or PV for short.
