

How to determine the size of aircraft energy storage systems?

Based on the comprehensive analysis of hydrogen economy, FC aging cost, and aircraft stability, a multi-objective parameter optimization model is established to decide the size of aircraft energy storage systems and hyper-parameters in the power controller.

Can fuel cell and battery energy storage improve aircraft performance?

Recent developments in fuel cell (FC) and battery energy storage technologies bring a promising perspective for improving the economy and endurance of electric aircraft. However, aircraft power system configuration and power distribution strategies should be reasonably designed to enable this benefit.

What are the characteristics of a chemical energy carrier?

Similar characteristics are expected of any potential chemical energy carrier and are eventually met by one: Hydrogen. Hydrogen can be produced at roughly 70 % efficiency via electrolysis of water using excess energy providing an energy sink in a highly integrated power grid, .

What is FC and battery hybrid energy storage technology?

The FC and battery hybrid energy storage technology is employed to improve the performance of the aircraft propulsion systems. This section develops an IEMPS framework to co-design aircraft power system hardware and control algorithm.

Are batteries and hydrogen a viable energy carrier solution?

Batteries and hydrogen are the most flexible and scalable energy carrier solutions amongst the previously introduced technologies and will play major roles in the transition to a renewable energy society without carbon emissions.

Can hydrogen be used as an energy carrier?

The storage of excess electrical generation, enabled through the electrolytic production of hydrogen from water, would allow "load-shifting" of power generation. This paves the way for hydrogen as an energy carrier to be further used as a zero-carbon fuel for land, air, and sea transportation.
