How do you find the real power of a volt?

The real power  $P$  in watts (W) is equal to the voltage  $V$  in volts (V) times current  $I$  in amps (A) times the power factor ( $\cos \theta$ ):  $P(W) = V(V) \cdot I(A) \cdot \cos \theta$ . The reactive power  $Q$  in volt-amps reactive (VAR) is equal to the voltage  $V$  in volts (V) times the current  $I$  in amps (A) times the sine of the complex power phase angle ( $\theta$ ):

One will be connected to ground and will read 0 volts. The other should read around 12 volts. Step 5: Repeat with all injector wiring harnesses. Leave the ground lead in position and test all of your injector wiring harnesses. They should all be around 12 volts. A lower reading means there is excess resistance in the wire somewhere.

In such cases, the voltage that could be fatal would need to exceed  $0.05 (50 \text{ mAmp}) \times 1000 = 50$  Volts. When submerged in water, such as during swimming, the body's resistance decreases further to about 150 ohms. Consequently, a voltage exceeding 7.5 volts ( $0.05 \text{ mAmp} \times 150 \text{ ohms}$ ) poses a significant risk. Another important factor is time.
