How to calculate the charging-discharging of a solar panel capacitor?

For exact calculation of the charging-discharging of the capacitor, we would need: The link to the datasheet of your solar panel. Information on the load attached to it (link if possible, minimum and maximum voltage.) You'll have to get more than 3V out of your panels and more than 3V on the cap/battery to get some seconds of 3V 500mA out of it.

Should I use a resistor or a capacitor for a solar panel?

The resistor is useless. Your solar panel already has a voltage decreasing when current increases (that is, it is not an ideal voltage source,) and the maximum current your small panel produces should be no issue at all for the capacitor. There is no reason to dissipate power as heat. The 1N4148 diode you use is not adapted for your application.

How to add Solar connectors to PV wires?

The steps to add solar connectors to PV wires are the following: Strip the wire. Place the connecting plate on it and use the crimping tool. Insert the lower components of the connector (terminal cover, strain reliever, and compression sleeve). Insert the upper components (safety foil, male/female MC4 connector housing, O-ring).

First, strip the solar panel's wire by about half an inch. Then, tin the end of the wire with solder. Next, place the diode so that the banded end faces the positive terminal of the solar panel. Solder the wire to the anode of the diode. Then, slide a piece of heat shrink tubing over the connection and heat it until it shrinks.

To wire your solar panels in series, simply link the positive MC4 connector of the first solar panel to the negative MC4 connector of the next one, and continue this pattern for the remaining panels. Once you're finished, you'll have two unconnected terminals at each end of your series--a positive and a negative.
