Solar panel backtracking uses a motor and tracking control program that adjusts the tilt of the panels as the sun moves across the sky throughout the day and the year. This maximizes the direct sunlight that reaches the panel from the sun's path by reducing the shading from the adjacent rows of panels to limit production losses.

Changing the light intensity incident on a solar cell changes all solar cell parameters, including the short-circuit current, the open-circuit voltage, the FF, the efficiency and the impact of series and shunt resistances. The light intensity on a solar cell is called the number of suns, where 1 sun corresponds to standard illumination at AM1.5, or 1 kW/m².
