Suppose, in our case the load is 3000 Wh/per day. To know the needed total W Peak of a solar panel capacity, we use PFG factor i.e. Total W Peak of PV panel capacity = $3000 / 3.2$ (PFG) = 931 W Peak. Now, the required number of PV panels are = $931 / 160W = 5.8$. This way, we need 6 numbers of solar panels each rated for 160W.

When calculating how many panels your charge controller can support connected in series, be sure to use the solar panel's open circuit voltage, rather than the nominal voltage. For example, most 12V rated panels will actually produce up to around 18V when your system isn't drawing much of a load.
