

Lithium Batteries and Phase Change Energy Storage

Lithium-ion batteries are a common type of rechargeable battery, which have many advantages compared to other types of batteries, such as high energy density, long lifespan, low self-discharge, and good cycle stability, making them the most promising energy source in electronic devices and vehicles such as mobile phones, laptops, and electric ...

The electrochemical performance of lithium-ion batteries significantly deteriorates in extreme cold. Thus, to ensure battery safety under various conditions, various heating and insulation strategies are implemented. The present study proposes a hybrid heating approach combining active heating with passive insulation. Conceptual experiments were ...

The commonly used thermal management techniques, including forced air cooling and liquid cooling, are active methods that will consume electricity during operation [15]. On the contrary, the passive methods require no power consumption, which is more promising for the thermal management of lithium-ion batteries [16]. Among the passive ...

A new heat transfer enhancement approach was proposed for the cooling system of lithium-ion batteries. A three-dimensional numerical simulation of the passive thermal management system for a battery pack was accomplished by employing ANSYS Fluent (Canonsburg, PA, USA). Phase change material was used for the thermal management of ...

Lithium-ion batteries (LIBs) have emerged as highly promising energy storage devices due to their high energy density and long cycle life. However, their safety concern, particularly under thermal shock, hinders their widespread applications. Herein, a temperature-insensitive electrolyte (TI-electrolyte) with exceptional resistance to thermal stimuli is ...

Phase change material (PCM) cooling performs excellently in lithium-ion battery (LIB) thermal management. In order to improve the thermal conductivity of PCM, the new thermally-conductive composite phase change material (CPCM) was prepared with the paraffin wax (PA), expanded graphite (EG), and SiC/SiO₂ by physical adsorption method. The ...

Energy storage systems like Li-ion batteries are facing many challenges and one of the main challenges in these systems is their cooling component. PCMs could transfer the ...

Among these batteries, lithium-ion batteries (LiBs) have higher specific energy/massive energy, no battery memory effect, a low self-discharge rate, and lower maintenance charges. Nevertheless, they do come with some risks, such as overheating, leakages, or producing a crystalline formation concerning the electrodes.

However, the phase change components in PCM are typically composed of organic compounds that are combustible in nature. If the battery loses thermal control, the presence of PCM can exacerbate battery

combustion, leading to severe damage to the battery module and environmental safety [33]. Generally, the addition of flame retardant powder to ...

Electric vehicles are gradually replacing some of the traditional fuel vehicles because of their characteristics in low pollution, energy-saving and environmental protection. In recent years, concerns over the explosion and combustion of batteries in electric vehicles are rising, and effective battery thermal management has become key point research. Phase ...

The thermal management of lithium-ion batteries (LIBs) has become a critical topic in the energy storage and automotive industries. Among the various cooling methods, two-phase submerged liquid cooling is known to be the most efficient solution, as it delivers a high heat dissipation rate by utilizing the latent heat from the liquid-to-vapor phase change.

However, lithium-ion batteries are sensitive to the temperature, so the battery thermal management (BTM) is an indispensable component of commercialized lithium-ion batteries energy storage system. At present, there are mainly four kinds of BTM, including air medium, liquid medium, heat pipe and phase change material (PCM) medium.

This paper presents the simulations of the cooling system of a battery pack (BTPC) consisting of lithium-ion (LIN) plate batteries. The BTPC includes six battery cells (BTCL) in two rows with three BTCLs, which are placed in a channel with one inlet and two outlets. The laminar and steady airflow flows in the channel. Phase-change material (PCM)-filled ...

The performance of lithium-ion (Li-ion) batteries is significantly influenced by temperature variations, necessitating the implementation of a battery thermal management system (BTMS) to ensure optimal operation. A phase change material (PCM)-based BTMS stands out at present because of its cost-effectiveness and ability to maintain temperature uniformity.

Lithium-ion (Li-ion) batteries have become the power source of choice for electric vehicles because of their high capacity, long lifespan, and lack of memory effect [[1], [2], [3], [4]]. However, the performance of a Li-ion battery is very sensitive to temperature [2]. High temperatures (e.g., more than 50 °C) can seriously affect battery performance and cycle life, ...

Conventional energy storage systems, such as pumped hydroelectric storage, lead-acid batteries, and compressed air energy storage (CAES), have been widely used for energy storage. However, these systems face significant limitations, including geographic constraints, high construction costs, low energy efficiency, and environmental challenges. ...

Numerous scholars argue whether Lithium-ion batteries are capable of fulfilling future universal requirements of portable energy storage for longer time, primarily due to the requirement of high density by EVs for enhancing their adaptability.

Therefore, the ESS hybrid with lithium battery and supercapacitor has a large energy storage density and fast response rate, which can meet the rapid energy storage and release of renewable energy. However, the ESS still faces enormous challenges because lithium batteries suffer from severe voltage drop [7], capacity loss [13, 14], lithium plating, and life ...
