Only excessive radiation can harm the human body and potentially cause cancer. Photovoltaic (PV) power generation works by using the photoelectric effect of semiconductor materials to convert sunlight directly into electricity. The solar modules and mounting structures do not emit electromagnetic radiation.

When the semiconductor material absorbs enough sunlight (solar energy), electrons are dislodged from the material's atoms. ... Electricity generation at utility-scale PV power plants increased from 6 million kilowatthours (kWh) (or 6,000 megawatthours [MWh]) in 2004 to about 162 billion kWh (or 161,651,000 MWh) in 2023.

About 99% of the power generated from fossil fuels, nuclear and hydroelectric energy, and wind comes from
