How can ranfis control the frequency of a microgrid?

Our proposed control strategy is based on the Recurrent Adaptive Neuro-Fuzzy Inference System (RANFIS). This controller can dynamically adjust the active power output, thereby assisting in frequency control within the microgrid.

What is the frequency control strategy for a hybrid stand-alone microgrid?

In this paper, the frequency control strategy is designed for a hybrid stand-alone microgrid, which is robust against load disturbances, variations in weather conditions, and uncertainties in the microgrid parameters. The proposed intelligent control scheme relies on the Recurrent Adaptive Neuro Fuzzy Inference System (RANFIS).

How to control the frequency of a multi-microgrid?

In 15, a fuzzy controller is used to control the frequency of a multi-microgrid. In 16 two-level MPC control, 17, multiple MPC control, and 18 MPC control-based method for coordinated control of wind turbine blades and electric hybrid vehicles to reduce power fluctuations and microgrid frequency are presented.

How do we control the frequency of Islanded microgrids?

In the context of controlling the frequency of islanded microgrids, a common approach involves employing droop control based on active-frequency power droop characteristics.

How to improve microgrid stability?

To enhance microgrid stability, this control level must exhibit a suitable and efficient dynamic response to changes in power sources and loads. While the primary control loop governs the drooped frequency, it cannot directly restore the frequency to its nominal value.

How to control the frequency of a microgrid with distributed generation sources?

In this section, the frequency model of a microgrid with various distributed generation sources is first implemented to control the microgrid frequency. The proposed RANFIS controller is designed to reduce fluctuations in the microgrid frequency compared to other controllers.

From Figs. 12 and 13, by using the proposed ADP auxiliary control during the frequency regulation, it is obvious that the frequency response has shorter adjustment time and smaller fluctuation, and the charging power change of PV reserve power is also earlier to be stable. Since the auxiliary controller has the learning ability, the frequency tends to stabilize ...

The voltage and frequency of microgrid systems are changed when imbalances occur between power generation and demand. Thus, an important issue for systems is the operation in islanded mode. ... As indicated in the IC/ISO 62264 standard, the goal of fast-response primary control is to adjust the frequency

and amplitude of voltage references ...

In the microgrid, virtual synchronous generator technology can significantly enhance the anti-interference characteristics of the system frequency and bus voltage, as well as solve the problems ...

Microgrid frequency response when the parameters of the microgrid and primary/secondary control are out of synchronisation (Scenario 3). The study shows that standard inertia control ...

The frequency of the microgrid common AC bus is determined by the energy storage converter, implementing a proposed droop curve among the state of charge (SoC) of the battery and the frequency.

Through precise adjustment of fuzzy control output parameters, the voltage and frequency are adjusted to improve the microgrid effectively, at the same time, the dynamic characteristics of the microgrid improve the stability of ...

Renewable wind, solar and fuel cell sources are present in this structure, which due to their relatively slow dynamics and the impact of environmental changes, are rarely used for frequency control, and BESS, micro turbine and fuel cell have the largest share in providing the power needed to adjust the frequency. In this microgrid structure ...

In this method, based on power tracking, a fuzzy logic controller is designed to adjust the frequency adjustment coefficient adaptively, and fuzzy logic rules are used to optimize the power ...

For the wind-diesel based microgrid, the fluctuation of wind energy, random load and uncertain system parameters may cause large frequency deviations [1, 2]. With only diesel generator adjustment, it is difficult to assure the frequency stability because of ...

This paper tends to propose an improved voltage and frequency control strategy for island MGs consisting several converter-based DGs. The proposed control structure uses an advanced ...

As wind energy gains a larger footprint in global energy systems and demonstrates increasing utility in microgrid applications, the imperative for in-depth research into primary frequency regulation in microgrids incorporating wind ...

Local controllers monitor and adjust the operation of individual assets to ensure they contribute to the overall objectives set by the central controller [20 ... PI controller tuning in hybrid microgrid: Frequency response, root-locus: Islanded hybrid microgrid: Minimized frequency deviations, robustness: Controller tuning complexity

The suggested control method considerably decreases the system frequency undershoot by 0.09 Hz, maintaining the microgrid's performance and steady frequency. The VI constant using conventional control and the VIC-based fuzzy are compared in Fig. 12 (a) .

Due to the full charge or full discharge of the power, these systems may not be able to change and adjust the microgrid frequency; hence, the frequency will deviate from the critical value. Therefore, as shown in Fig. 6, connecting the microgrids through AC-to-AC converter as well as the proposed control strategy has been partially effective in frequency ...

The GA-ANN is used to control the frequency of a microgrid in an island mode to automatically adjust and optimize the coefficients of a PI-controller. The proposed PI-controller is located in the frequency control secondary loop of an island microgrid.

Many control studies have been done to adjust the frequency of different microgrids, especially in the islanded mode, among which the following can be mentioned: The proportional integral (PI) control method in [7-9], Ziegler-Nichols based method for adjusting proportional integral derivative (PID) controller parameters in [10], H_∞ controller to minimize ...

It can participate in the frequency control services of a micro-grid while conserving the charging demand of users, reducing the construction cost of the microgrid, and realizing a primary frequency modulation. Meanwhile, it can also achieve a secondary frequency adjustment of the microgrid while satisfying the charging demand of users.

operation of isolated microgrids; it is a proportional adjustment method but may face challenges during the transition to grid-connected states [18,19]. Currently, energy storage systems controlled through V/f control are commonly used to stabilize the voltage ... voltage; represents microgrid frequency; and represents microgrid phase.
