A microgrid is a local electrical grid with defined electrical boundaries, acting as a single and controllable entity. [1] It is able to operate in grid-connected and in island mode. [2] [3] A "stand-alone microgrid" or "isolated microgrid" only ...

A flywheel is connected as the energy storage of the system. A MicroGrid is expected to operate in a non-autonomous way if interconnected to the main grid, and in an autonomous way if disconnected from it. Electrical safety of a MicroGrid is an overriding operationalh requirement and its earthing and protection are critical.
