1 Introduction. Real-time power flow management is a contemporary topic in scientific literature. It is gaining prominence to boost the intelligence and adaptability of multi-energy systems, such as smart grids, microgrids, smart homes, and hybrid electric vehicles (George and Ravindran, 2019; George and Ravindran, 2020; George et al., 2021). ...

A microgrid can be architected to function either in grid-connected or standalone mode, depending upon the generation, integration potential to the main grid, and consumers" requirements. The amalgamation of distributed energy resources-based microgrids to the conventional power system is giving rise to a new power framework.
