In contrast, places with energy outflows have diminishing capacity due to a gradual depletion of energy. Furthermore, China's conventional energy transportation system based on coal has many drawbacks. About 75 % of China's primary energy comes from coal, but China's transportation infrastructure needs to meet the demand.

The structure decomposition analysis revealed that the growth of the overall water and energy consumption of China tourism is mainly driven by the growth of the total tourism expenditure, i.e. the scale effect. It is the
