Obviously, dual-axis tracker systems show the best results. In [2], solar resources were analysed for all types of tracking systems at 39 sites in the northern hemisphere covering a wide range of latitudes. Dual-axis tracker systems can increase electricity generation compared to single-axis tracker configuration with horizontal North-South axis and East-West tracking from ...

The solar photovoltaic bracket adjusts the solar panel to the best sunlight irradiation angle through a proper installation angle, so as to maximize the energy conversion efficiency of the solar panel. This can not only improve the power generation efficiency of solar photovoltaic system but also save energy and reduce costs.

The tracking photovoltaic bracket can adjust the angle of the photovoltaic module in real time according to the position of the sun, so that it is always facing the solar radiation, thereby maximizing energy output. Compared with fixed photovoltaic brackets, tracking photovoltaic brackets can achieve higher power generation efficiency. 2.

There were three typical working conditions for PV modules: when wind direction angle was  $20^\circ$ , all PV modules were subject to downward pressure; when wind direction angle was  $120^\circ$ , one row of PV modules was subject to downward pressure and the other row was subject to upward lifting; when wind direction angle was  $140^\circ$ , both rows were subject to upward lifting.

3. Clamps: A fixing element placed at the end of each guide is used to hold a photovoltaic module correctly. We can also find them intermediate to fix two panels together. 4. Guide joints and fixings: Component used to join various profiles together. When two guides meet, we use a union to make the structure of the solar panels more resistant.
