

What is a series connected PV module?

The entire string of series-connected modules is known as the PV module string. The modules are connected in series to increase the voltage in the system. The following figure shows a schematic of series, parallel and series parallel connected PV modules. PV Module Array To increase the current N-number of PV modules are connected in parallel.

What is series solar panel wiring?

Wiring solar panels in series means wiring the positive terminal of a module to the negative of the following, and so on for the whole string. This wiring type increases the output voltage, which can be measured at the available terminals. You should know that there are limitations for series solar panel wiring.

How are PV modules connected in series and parallel?

In large PV plants first, the modules are connected in series known as "PV module string" to obtain the required voltage level. Then many such strings are connected in parallel to obtain the required current level for the system. The following figures show the connection of modules in series and parallel.

Connecting PV modules in series and parallel are the two basic options, but you can also combine series and parallel wiring to create a hybrid solar panel array. Some solar panels have microinverters built-in, which impacts how you connect the modules together and to your balance of system. What Are They?

How to connect solar panels in parallel configuration?

The parallel combination is achieved by connecting the positive terminal of one module to the positive terminal of the next module and negative terminal to the negative terminal of the next module as shown in the following figure. The following figure shows solar panels connected in parallel configuration.

When we connect N-number of solar cells in series then we get two terminals and the voltage across these two terminals is the sum of the voltages of the cells connected in series. For example, if the of a single cell is 0.3 V and 10 such cells are connected in series than the total voltage across the string will be $0.3 \text{ V} \times 10 = 3 \text{ Volts}$.

The photo-voltaic (PV) modules are available in different size and shape depending on the required electrical output power.
