While connecting the stringing in series, the wire from the positive terminal of one solar panel is connected to the negative terminal of the next panel. When stringing panels are interconnected in series, each additional panel adds to the total voltage (V) of the string, but the current (I) in the string remains the same.

The junction box contains terminals where the solar panel wires can be connected to the electrical system wires. This makes it easy to install and maintain the solar panel system. Protecting the Solar Panel from Damage. The junction box protects the solar panel from damage in the event of shading, partial damage, or electrical overload.

Remember that with parallel wiring the amperage increases, so the total short circuit current of this solar array is 36.27 Amps ($12.09A \times 3 \text{ panels} = 36.27A$).. In the event of a fault or short circuit in one of the panels, the other two panels would dump 24.18 Amps of current into the faulty panel ($12.09A \times 2 \text{ panels} = 24.18A$).

Types of Solar Panel Connectors and Their Specifications. Solar energy has grown a lot thanks to new connector tech. MC4 connectors stand out because they fit many needs and are technically superior.
