In their paper entitled "Nighttime Photovoltaic Cells: Electrical Power Generation by Optically Coupling with Deep Space", academics Tristan Deppe and Jeremy N. Munday explain that through the use of the night sky as a heat sink and the earth as a heat source, a photovoltaic cell can be devised that generates energy at night.

Solar energy technologies are divided into: (1) photovoltaic solar systems, which directly convert the solar energy to electricity, (2) active solar systems, which convert the solar radiation in heat, and (3) bioclimatic design and passive solar systems, which include architectural solutions and the use of appropriate building materials to maximize the direct ...

What is photovoltaic (PV) technology and how does it work? PV materials and devices convert sunlight into electrical energy. A single PV device is known as a cell. An individual PV cell is usually small, typically producing about 1 or 2 watts of power. These cells are made of different semiconductor materials and are often less than the thickness of four human hairs.
