A microgrid is contained of fixed modules and flex modules. Some modules can be both -- GridModule, for example -- but not at the same time. A fixed module has requires a request of a certain amount of energy ahead of time, and then attempts to produce or consume said amount. LoadModule is an example of this; you must tell it to consume a certain amount of ...

As an efficient way to integrate multiple distributed energy resources (DERs) and the user side, a microgrid is mainly faced with the problems of small-scale volatility, uncertainty, intermittency and demand-side uncertainty of DERs.
