

The generator will keep putting out power as it comes to a stop, and that means your home's electrical load could drain the residual magnetic field from the generator's coils. You will not notice anything wrong when you restart the generator because it will run but not create power because the coils are dead.

Power demands can fluctuate dramatically, so the ability to scale power generation is crucial. Pairing multiple generators, also known as generator paralleling, offers a flexible and efficient solution to meet varying power needs. This guide will walk you through the process, benefits, and considerations of using multiple generators in parallel.

Your meter simply measures a very very poor power factor with a lot of apparent power, so there is no active power of 1150W, it is apparent power so you do not get charged ! Input active power = Apparent power * Power Factor = $(223.5\text{VAC} * 2.45\text{Arms}) * 0.0816 = 547.57\text{VA} * 0.0816 = 44.68\text{Watt}$
